SOULMATE tool

Everyone ages, SOULMATES enjoy it!

With SOULMATE, we combine the best of two worlds: On the one hand, we provide an accessible, friendly and professional *solution* to *stay mobile for as long as possible and to* get help when needed. On the other hand, we use modern and proven technology to provide service and solutions at its best. This combination, together with an experienced team consisting of both technical and scientific team members, guarantees that SOULMATE is able to fulfil current and future needs regarding *increased mobility, a feeling of security and elderly* health care. Provided in the form of a rock solid and highly adoptable system, SOULMATE is the one and only solution that fits perfectly for health- and elderly care organizations to help them to extend their services to a completely new level.

In short, SOULMATE helps elderly people *to stay mobile and independent* with a navigation application and to *feel secure, by making sure help is always available when needed.* SOULMATE concentrates on the following aspects:

- Simplifying the process of getting help
- Insights about geographical movement of the elderly person made available to the caregivers
- Access to additional point of interest information along the planned routes

SOULMATE ensures that one stays mobile for longer

When people get older and less healthy, they tend to be less mobile, since they feel less secure. This triggers a negative spiral: people travel less than before, get even more physical and mental issues, and therefore feel even less safe while traveling. SOULMATE ensures that the user knows his route at all times, knows where he is and where he is going, even when unexpected things happen. If a feeling of unease occurs, SOULMATE can always request the help of a set of preselected persons and organisations.

SIMPLIFIED VIDEO ASSISTANCE

SOULMATE offers a simple, intelligent mechanism to *get help from friends, family or health care professionals whenever needed by a video call*. Contacted people are able to analyse the current location of the caller and can establish a live video-connection with them. The software system is based on modern web-based technology, which allows contacted persons to interact with SOULMATE, even if they have the app not installed.

CHAINED REQUEST FOR ASSISTANCE

If a request for assistance is to be sent out, SOULMATE applies a chain-based mechanism to contact a sequence of people until someone responds. At the end of the sequence, a professional service provider is available to guarantee a response to each request that is triggered.

MOVEMENT-TRACKING AND ALERTING

SOULMATE allows to monitor whether SOULMATE app users are staying on their intended routes. This means, that whenever elderly people leave the predefined route that was selected, SOULMATE automatically alerts the user, and, if needed, messages pre-defined contacts to inform them so that they can assist.

POINT OF INTEREST INFORMATION

For people who are not used to the local environment, SOULMATE allows users to look up nearby toilets, taxis and restaurants along their routes.
